

ISOLATION AND CHARACTERIZATION OF SIX HIGHLY INTRINSIC FLUORESCENT METABOLITES IN *ARMILLARIA MELLEA* (VAHL. EX. FR.) KARST

H. Ebrahimzadeh and G. R. Haddadchi

Department of Biology, Faculty of Science, University of Tehran, Islamic Republic of Iran

Abstract

Six fluorescent compounds were isolated and characterized in rhizomorph of *A. mellea* and were presented first as: F₁, F₂, F₃, MF₁, MF₂ and MF₃. These compounds differed by R_f on chromatoplaque, λ_{max} in UV spectra and λ_{ex}, λ_{em} and λ_{max} in fluorescence spectra. Their GC-MS analysis indicated that F₁ has a phenolic moiety and the other five are the benzenic derivatives. F₁ compound was more fluorescent resulting from its hydroxyl group. The difference between the fluorescent compounds of rhizomorph and hyphae suggests the participation of some of these compounds in differentiation. Moreover, these compounds may have antibiotic activity against their hosts or enemies.

Introduction

Armillaria mellea (Vahl ex. Fr) Karst, the honey fungus, is so called because of the honey-coloured carpophore or rhizomorph. This basidiomycete is the cause of widespread root disease in deciduous plants such as *Betula* sp., *Citrus domestica*, *Vitis vinifera*, and evergreen trees such as *Juniperus* sp. [1]. Many biologically active sesquiterpene esters have been isolated from different strains of the fungus. The crystalline metabolite, armillane, was isolated from the extracts of the mycelium of *A. mellea* obtained from cultures grown for 30 days [2].

The molecular formula C₂₃H₃₂O₇ of the armillane was established by elemental analysis and FARMS (cMH) m/z 421 [2]. *A. mellea* is known to produce chemical defense metabolites possessing antibacterial activity [1]. These compounds, which have an unusual hydroxylation at C-10 and C-13, are new members of

the protoilludane sesquiterpenoids, a group of fungal metabolites first isolated from *Clitocybe illudans* [3]. It has been suggested that they are derived from a protoilludane intermediate arising from farnesol via humulene. The first isolated compound of this type from *A. mellea* was armillol arsellinate [4, 5].

In China, tablets containing artificially cultured mycelium of *A. mellea*, are used for the treatment of dizziness, headaches, neurasthenia, insomnia, numbness in limbs and infantile convulsions [6].

We observed that, in the Knop-Heller media, serine promotes differentiation from hyphae to rhizomorph [7]. In this report, some fluorescent compounds are isolated and characterized in rhizomorph; the attacking organ of *A. mellea*.

Materials and Methods

A. mellea was obtained from *Quercus sativus* from the forest of Karasang in Amol, Iran. The growth of

Keywords: *Armillaria mellea*; Fluorescent compounds

the fungal stalk (5 mm long disk) was initiated on malt-agar culture medium at 25°C, which was transferred to other media later. Knop-Heller and ammoniacal Knop-Heller (NO₃⁻ replaced by NH₄⁺) medium with or without pepton 5 g/l were used to produce mycelia with or without differentiation to rhizomorph [7].

For more rhizomorph production, we used prune juice (20 g prune drupe was filtered through a layer of cheesecloth in boiling distilled water). About 5-10 segments of fungi on malt-agar were transferred to sixty Erlenmeyer flasks and grown for 45 days.

Fungus cultures of various organs were filtered through a layer of cheesecloth and the filtrates were extracted five successive times with 0.1 volume (V/V) of chloroform in a separatory funnel. The chloroform extracts were evaporated at 60°C.

Vegetative structures from the above cultures were dried for 24-48 h at 60°C, ground and extracted in a Soxhlet apparatus for two days with chloroform.

The chloroform extracts were filtered and evaporated. The extracts were then chromatographed on a column of silica gel (0.45 mm) using hexane-ethylacetate (2:1, V/V). Further purification was achieved by preparative TLC (PLC) using the same solvent. Then each band on the plate was chromatographed on a column of silica gel (0.45 mm) using hexane-ethylacetate (2:1, V/V).

Absorption spectra were recorded on a Shimadzu-160 UV-VS spectrophotometer. Corrected fluorescence excitation and emission spectra were obtained by use of a Shimadzu RF-5000 spectrophotometer. Fluorescence spectra of TLC were recorded by a Shimadzu CS-9000 densitometer. Gas chromatography-mass spectrometry (GC-MS) was carried out with the following general conditions:

a) Gas chromatography: apparatus NIST; column DB-5, 30 m; temperature 215°C.

b) Mass spectrometry: apparatus NIST; ionization voltage 70 eV; source temperature 150-215°C.

Results and Discussion

Successive purification of the chloroform extracts of the fungal culture, undifferentiated hyphae, differentiated hyphae and rhizomorph led to the isolation of six intrinsic fluorescent metabolites: F₁, F₂, F₃, MF₁, MF₂, and MF₃ which had vivid blue fluorescence in TLC at 360 nm in the UV-cabinet. The TLC of the last purification of these compounds is shown in Figure 1. The R_f and λ_{max} in UV spectra of these compounds are presented in Table 1.

Their UV and fluorescence spectra are shown in Figures 2 and 3, respectively, and their λ_{ex}, λ_{em} and

λ_{max} of fluorescence spectra are presented in Table 2. These fluorescent compounds also exist in culture

Table 2. λ_{ex} , λ_{em} and λ_{max} of fluorescence spectra in methanol

Fluorescent Compounds	λ_{ex} (nm)	λ_{em} (nm)	λ_{max} (nm)
F ₁	360	467.0	440.8, 449.6, 507.2, 633.6
F ₂	360	459.2	409.6, 446.4, 502.4, 620.4, 620.8
F ₃	365	465.6	392.0, 446.4, 505.6, 616.0
MF ₁	360	462.4	412, 8, 500.8, 619.2
MF ₂	365	465.6	392.0, 452.8, 505.6, 616.0
MF ₃	365	465.6	409.6, 505.6, 619.0

medium of rhizomorph. Fluorodensitometric spectra of the chloroform extract TLC of rhizomorph and its culture medium indicated the similarity (Fig. 4). Fluorescence intensity of the compounds in the methanol and the aqueous media such as Tris-HCl buffer, pH 7.4 is different (Tables 3, 4).

F₁ compound in the Tris-HCl pH 7.4 has remarkable fluorescence intensity because of the hydroxyl group which exists in this compound, but which is not found in others. F₁ with a high

Table 5. Names, formula and molecular weights of the fluorescent compounds

Fluorescent Compounds	Name	Formula	Molecular Weight
F ₁	Phenol, 2,6-bis (1,1 dimethyl ethyl) 4-ethyl	C ₁₆ H ₂₆ O	234
F ₂	1,2-Benzendicarboxylic acid diisooctyl - yl ester	C ₂₄ H ₃₈ O ₄	390
F ₃	1,2-Benzendicarboxylic acid (2-methoxy ethyl) ester	C ₁₄ H ₁₈ O ₆	282
MF ₁	1,2-Benzendicarboxylic acid buty 1-2-ethyl hexyl ester	C ₂₀ H ₃₀ O ₄	334
MF ₂	Iron, tricarbonyl (N-pheny 1-2-pyridinyl methyl benzenamine - N, N')	C ₂₁ H ₁₄ O ₃ N.Fe	398
MF ₃	1,2-Benzendicarboxylic acid butyl decyl ester	C ₂₂ H ₃₄ O ₄	362

Table 6. Names, formula and molecular weights of the non-fluorescent compounds

Name	Formula	Molecular Weight
Eicosane, 10-methyl	C ₂₁ H ₄₄	296
1-Hexadecanoic	C ₁₆ H ₃₄ O	242
Docosane	C ₂₂ H ₄₀	310
Heptadecane, 2,6-dimethyl	C ₁₉ H ₄₀	268
Undecane, 3,8-dimethyl	C ₁₃ H ₂₈	184
Hexadecanoic acid	C ₁₆ H ₃₂ O ₂	250
1-Heptanol, 2,4-dimethyl- (R, R)-(+)-	C ₉ H ₂₀ O	144
1-Octanol, 2-butyl	C ₁₂ H ₂₆ O	180
Decane, 2,4-dimethyl	C ₁₂ H ₂₆	170
Octacosane	C ₂₈ H ₅₈	394
1-Hexanol, 2-ethyl-2-propyl-	C ₁₁ H ₂₄ O	172
Hexanoic acid, 2-methyl-3-oxo- ethyl ester	C ₉ H ₁₆ O ₃	172
Octadecanoic acid	C ₁₈ H ₃₆ O ₂	284
Dodecane, 2, 6, 10-trimethyl	C ₁₅ H ₃₂	212
Cyclopenta decanone-2-hydroxy	C ₁₅ H ₂₈ O ₂	240

fluorescence intensity may be used in biochemical and biophysical methods for tracing and interaction studies, such as interaction of a fluorescent ligand like actinomycin and DNA [11]. Many of these fluorescent compounds secreted into medium may have antibacterial and fungicidal activity [12]. F₂ compound or 1,2-benzendicarboxylic acid diisooctyl - yl ester (Table 5) may be one of the resistant agents against fungal and bacterial attacks [13].

GC-MS Computer Analysis of Fluorescent Compounds

The study described herein falls within the outline of a comprehensive programme dealing with the construction of a data bank in NIST computer analysis.

Total ion current profiles of the six fluorescent compounds before last purification (F₁, F₂, F₃, MF₁, MF₂, and MF₃ groups) are shown in Figures 5-10. In each profile, the peak with its scan number represents the fully purified fluorescent compounds (F₁, F₂, etc) in the last purification. The peaks in each profile, except for the asterisk peak, represent the nonfluorescent compounds.

The name, formula and molecular weight of the fluorescent compounds are presented in Table 5, and of non-fluorescent compounds in Table 6. The structural formula of these fluorescent compounds are identified by some references [8, 9, 10].

None of the fluorescent compounds is from known sesquiterpenoids or sesquiterpene esters group, and therefore differ from armillane [1] and armillol arsellinate [4, 5] of *A. mellea*. However, they exhibit antibacterial and antifungal activity similar to that of armillane and armillol arsellinate [1]. Moreover, the fluorescent metabolites that exist in hyphae are

different from those of rhizomorph [14] and the appearance of some of these in explants may be related to the differentiation of rhizomorph on these fragments.
